GIS: Layers of Data

A **geographic information system** (GIS) integrates hardware, software, and data for capturing, managing, analyzing, and displaying all forms of geographically referenced information.

GIS allows us to view, understand, question, interpret, and visualize data in many ways that reveal relationships, patterns, and trends in the form of maps, globes, reports, and charts.

GIS first termed by Roger Tomlinson (1968) A Geographic Information System for Regional Planning

History

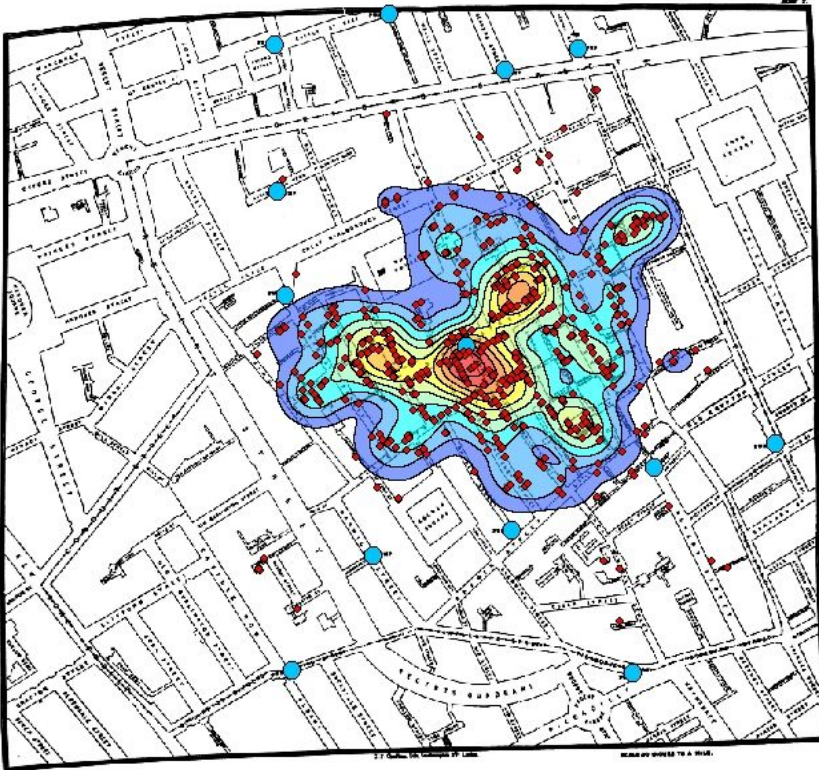

First “GIS”: John Snow’s 1855 map of 1854 cholera outbreak in London spatially related to a few wells.
Epidemiology

Benjamin Franklin, US
Postmaster in 1769: “A
River In The Sea”.
Oceanography

Now

Interpolated surface (IDW)
from point values, plus contouring

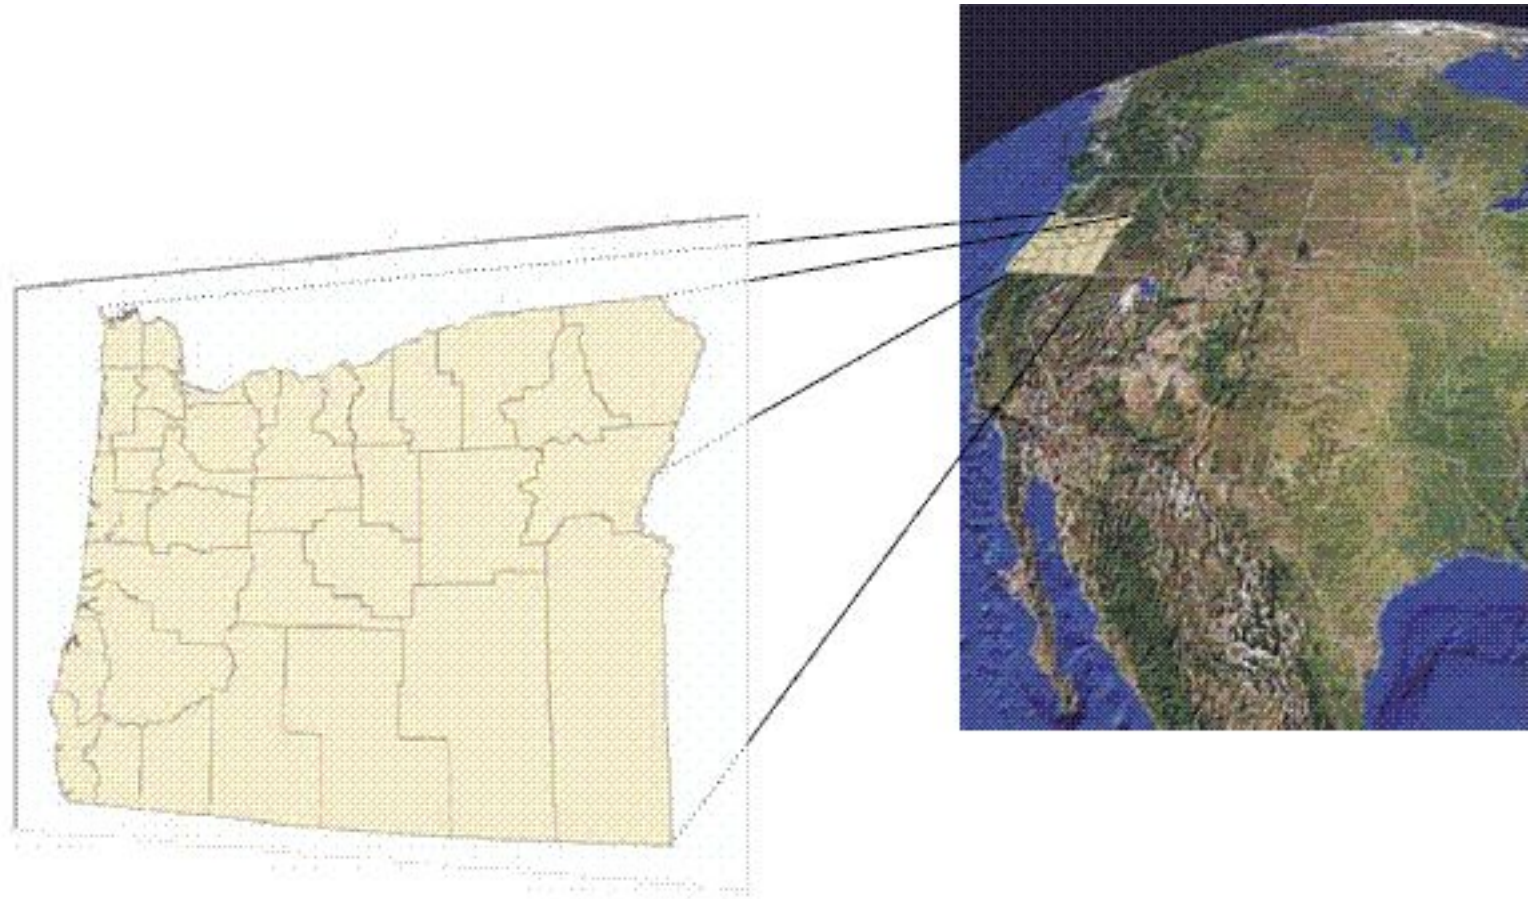

Remote sensing of
sea-surface temperature

Map Projections

Geographic to Projected Coordinate System

Unlike a geographic coordinate system, a projected coordinate system has constant lengths, angles, and areas across the two dimensions. However, all map projections representing the earth's surface as a flat map create **distortions** in some aspect of distance, **area**, **shape**, or **direction**.

Visualizing Distortion of Projections

Tissot's Indicatrix

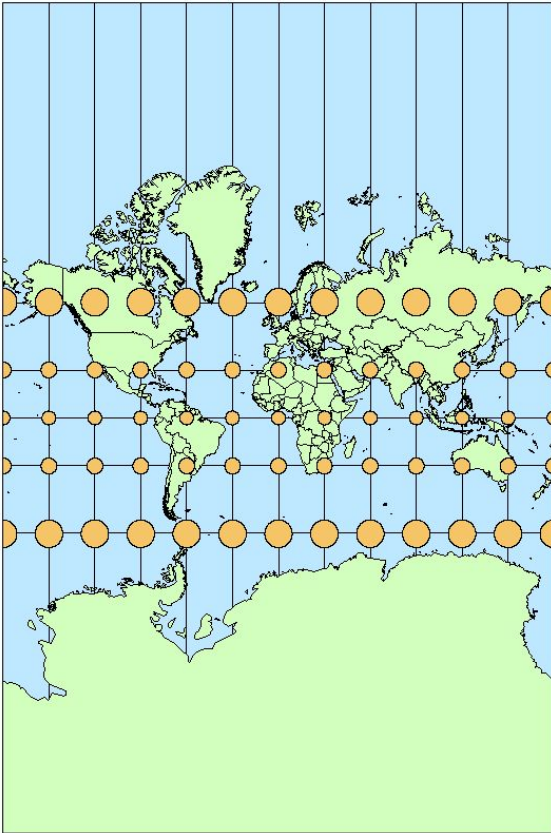

Distortions,
at least 1 or more:

- Distance
- Angle
- Area

view from space of geographic coordinate system

Equal Angle or Area

Conformal (preserved angle,
distorted area): ***Mercator***

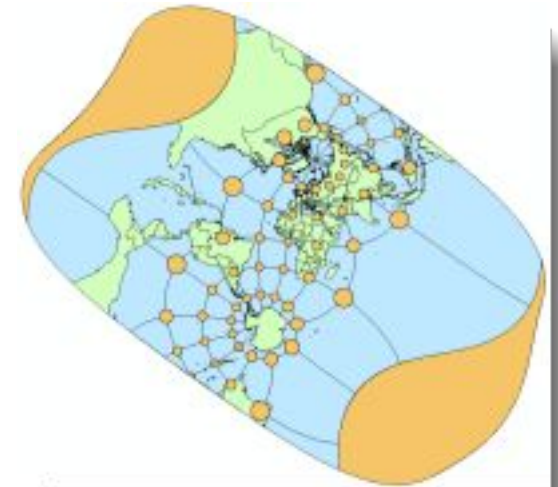

Equal area (distorted angle): ***Mollweide***

Compromise Projection

Compromise projection (vary in size, shape, angle): ***Winkel Tripel***

Oblique Mercator

Why are We changing the Maps?

“Because ... the Mercator projection has fostered European imperialist attitudes for centuries and created an ethnic bias against the Third World....”

says the Organization of Cartographers for Social Equality
[West Wing season 2, episode 16]

Mercator

Galls-Peters

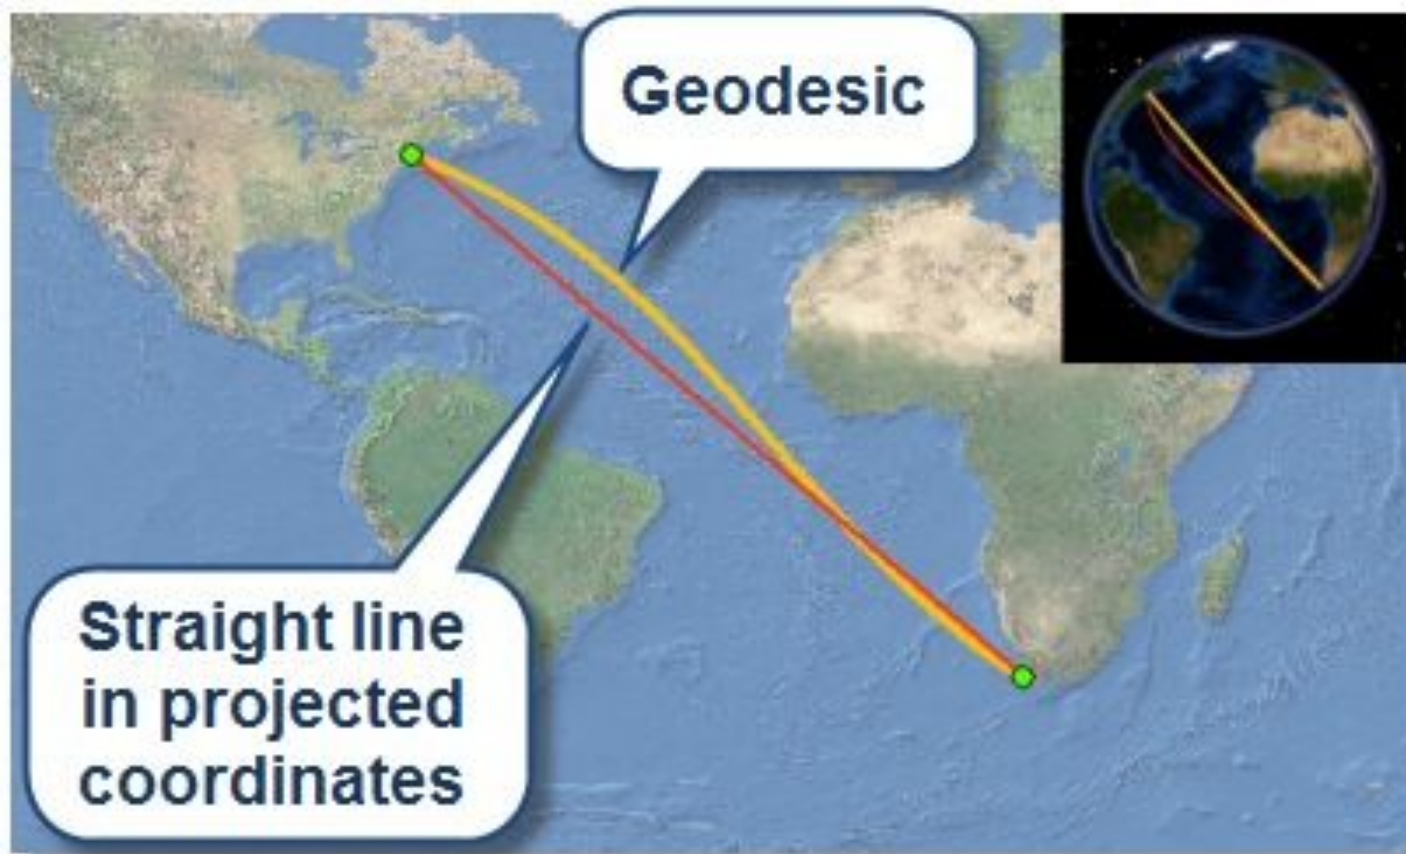

True Size of Africa

Geodesic Distance, Area & Buffer

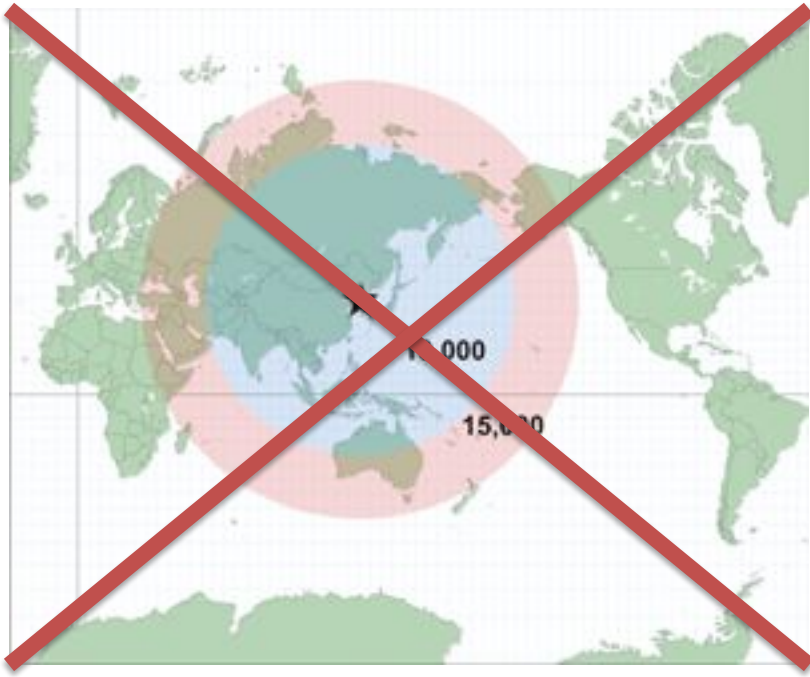

geodesic = shortest distance along surface of a geoid (aka spheroid)

New to ArcGIS 10.1, so often do not need to project layers from geographic.

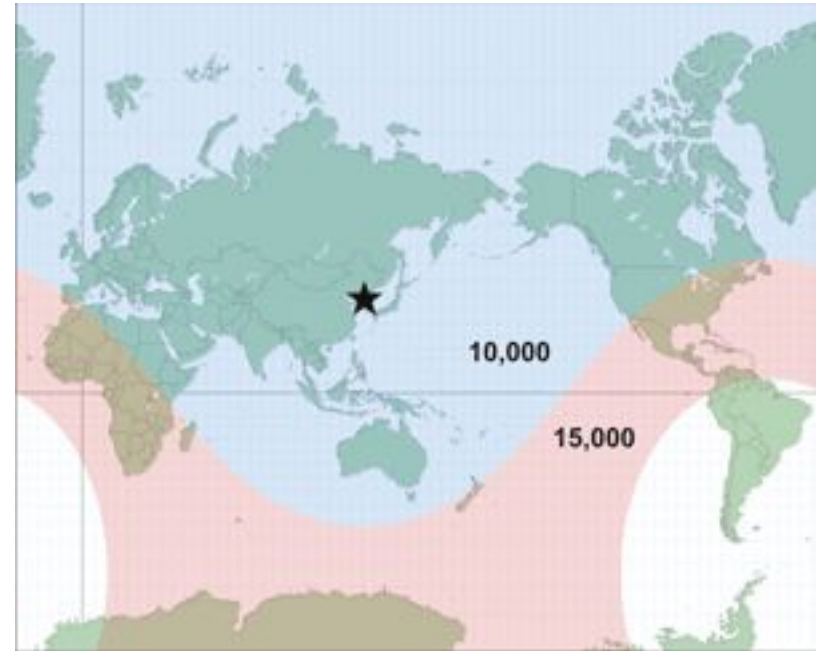

Geodesic Real World Example

“Ranges” for missiles launched from North Korea
